

Recommended Solutions for Possible LMS Mobile App Issues

The following solutions are based on the possible usability issues and recommendations identified in the LMS mobile app usability testing notes.

Possible Issue	Recommended Solution
Buttons are too small	Increase button size and spacing so they are easier to tap. Use readable text and maintain adequate touch targets for accessibility.
Navigation is confusing	Simplify the navigation menu and organize features into clear categories such as Courses, Announcements, Assignments, Discussions, and Grades.
Important features are difficult to locate	Use clear labels, familiar icons, and prominent placement for frequently used features. Add search or shortcuts where appropriate.
Assignment upload takes too many steps	Reduce the number of screens required to upload and submit an assignment. Provide a clear Upload → Review → Submit process and confirmation after submission.
Announcements load slowly	Optimize the loading of announcement content, reduce unnecessary data requests, and consider caching frequently accessed content.
Discussion pages load slowly	Optimize page content and data retrieval, use pagination where appropriate, and avoid loading unnecessary discussion content at once.

Additional Recommendation

After implementing the solutions, the app should be tested again with students and lecturers. The results should be compared using task success rate, time on task, error rate, ease of use, and user satisfaction to determine whether the changes improved usability.

The intended outcome is for users to access course materials and announcements, submit assignments, participate in discussions, and view grades and feedback quickly, with minimal errors or confusion.
